

Simple Reactor Example

Simple web app using reactor to store and react to incoming packets via email with archived storage using Amazon S3

Here the only pieces you build would be those marked in Green.
(Both of the Sink adaptors in the example are planned to be included as standard parts of Reactored at a later stage)

Your app could for example be a web forum, here is what you would get for free:

- 1) Indexing of all forum entries for search
- 2) Tagging and tagged retrieval of forums/contributions
- 3) Forum based queries on attributes like status
- 4) Access control lists to control security
- 5) The ability to approve/control entries
- 6) User/participant storage with home/profile pages
- 7) Audit trail of every write/update request
